EP 0 678 241 B1

Description

[0001] This invention relates to chemically, physically and microbially stable concentrated suspensions of natamycin which provide a convenient stock for the easy and reproducible dosage of the fungicide, e.g. to animal feed or grain or for manufacturing liquid preparations to treat food such as cheeses and sausages or to treat agricultural products such as vegetables, fruit and flower bulbs. Further the invention relates to solid compositions of natamycin for preparing such suspensions.

Description of the prior art

[0002] For more than 20 years, natamycin has been used to prevent growth of mould on cheeses and sausages. (Ref. 1-3) Cheeses are treated by immersion in a suspension of natamycin in water or covered by an emulsion of a polymer (mostly polyvinyl acetate) in water containing natamycin. Sausages are mainly treated by immersion or by spraycoating with a suspension of natamycin in water. Usually aqueous suspensions for immersion treatments contain 0.1 to 0.2% (w/v) of natamycin, while polymer emulsions for coating purposes contain 0.01 to 0.05% (w/v) of natamycin.

[0003] For the production of such suspensions or polymer emulsions, the natamycin may be added directly to the liquids as a powder, for instance by using the wettable powder composition known under the brand name of Delvovid® Instant. Instead of using the powder as such, frequently a concentrated pre-suspension of the natamycin in water is prepared before adding the natamycin to the liquids to be used for treatments. The purpose of preparing a presuspension is to avoid lump formation and to facilitate homogenisation of natamycin through the treatment liquids. Mostly these methods of preparing suspensions for treating food are adequate. However, when several types of suspension with varying concentrations of natamycin have to be prepared or several portions of large quantities need to be produced over a longer period such methods are less convenient.

[0004] When natamycin is added as a powder to treatment preparations, the laborious weighing of the powder has to be repeated for each type of suspension, thus multiplying the nuisance of possible dust problems.

[0005] When a presuspension in water is used to avoid inaccurate dosages, the presuspension has to be agitated continuously to prevent the natamycin from settling down or the presuspension has to be added in total to the treatment preparations. Furthermore, such suspensions are susceptible to undesirable bacterial contamination and cannot be used as a stock for long periods without taking precautions, e.g. addition of a preservative.

[0006] A possible way to avoid sedimentation is to make a stock solution of natamycin instead of a suspension. Aqueous solutions of natamycin can be prepared by adjusting the pH of the mixture to a high or a low

value. However, under such conditions the stability of natamycin is rather poor (Ref. 4, page 542).

[0007] Aqueous suspensions of natamycin are well known in practice. Under the brand name of Pimafucin®, sterile suspensions of natamycin are commercially available as a 1% or a 2.5% presentation in small bottles of up to 100 ml. Pimafucin® is mainly used for medical purposes. To render these suspensions suitable as a multiple dose presentation the suspensions are preserved by using benzalkonium chloride, a preservative of the quaternary ammonium type. Because of the sedimentation of the solid natamycin, such a suspension has to be shaken well every time prior to use. Further to avoid excessive inactivation of the natamycin, the pH of Pimafucin® is usually adjusted to a value of 5.5 to 7.5.

[0008] Because of the sedimentation problems and the bacterial vulnerability of known suspensions of natamycin, and the instability of solutions of natamycin, an aqueous stock preparation of natamycin which may be dosed by volumetric methods and which remains stable for a prolonged period, e.g. to manufacture treatment liquids for cheeses or sausages, has up till now not been considered a practical proposition.

Summary of the prior art

[0009] Suspensions of natamycin are well known. Nevertheless the use of concentrated suspensions to serve as a stock for long periods or even to be used during only one day is not known. This is mainly because of (1) the tendency of the sparingly soluble natamycin to settle down, (2) the chemical instability of natamycin at low and at high pH values and (3) the susceptibility of natamycin suspensions to bacterial growth. Moreover an aqueous solution of natamycin as a stock is not possible because of the instability of natamycin in solution.

OBJECT OF THE INVENTION

[0010] The object of this invention is to provide chemically, microbially and physically stable concentrated aqueous stock suspensions of natamycin, which are suitable to be used over at least several days without a preservative and without the necessity for complicated equipment either for the preparation or the dosage thereof.

SUMMARY OF THE INVENTION

[0011] Unexpectedly it has been found that, without using preservatives, by applying a suitable pH range and using a thickening agent it is possible to produce concentrated aqueous suspensions of natamycin, which are chemically and microbially stable for more than 14 days and which have a physical stability of at least several hours.

[0012] Surprisingly such suspensions of natamycin

have been obtained with a pH of lower than 6, more particularly a pH of lower than 5.1. The pH of a suspension according to the invention will be in the range from 3 to 5.1, preferably from 3.5 to 5.1 and more preferably from 3.5 to 4.5. Thus, a pH of about 4.0 is considered, for example, desirable, although a slightly lower pH, e.g. 3.6, or a slightly higher pH, e.g. 5.0 is equally acceptable.

[0013] The new suspensions are very convenient for use as a stock for the easy and reproducible dosage of natamycin, e.g. for use in the large scale production of coating emulsions for the treatment of cheeses. The concentration of the polyene fungicide in a stock suspension of the invention may be as high as 40% (w/w). Preferably, the concentration of fungicide is from 0.5 to 30%, more preferably from 2 to 25% and most preferably from 5 to 20%.

[0014] To provide a suspension with sufficient physical stability, any thickening agent which is known in the art or any combination of such thickening agents may be used. Preferred thickening agents for use in a suspension of the invention are those which have thixotropic or shear thinning and/or pseudoplastic properties such as, for example xanthan, carrageenan, methylcellulose, Arabic gum and combinations thereof.

[0015] When a thickening agent without shear thinning properties is used, the viscosity of the suspension is at least about 500 mPa, more preferably from about 1000 to 5000 mPa and most preferably from about 1000 to 3000 mPa. When a thickening agent with shear thinning properties like xanthan is used, the viscosity of the suspension without shear may be more than 50,000 mPa.

[0016] Another feature of the invention is a method of forming a suspension of the invention by mixing a solid composition with water. Preferably, wettable powder formulations for this purpose contain at least the polyene fungicide, ie. natamycin, a thickening agent like xanthan or methylcellulose and preferably a surfactant like sodium dodecyl sulphate. Optionally a buffering system, e.g. of the phosphate and/or of the citrate type, may be incorporated in the powder mixture.

[0017] Suspensions of the invention may be used directly to treat a food, feed or agricultural product with natamycin or may be used to prepare an alternative suspension or coating emulsion for such treatment.

DETAILED DESCRIPTION OF THE INVENTION.

[0018] In one aspect, the present invention provides an aqueous suspension of natamycin having a pH of lower than 6, more particularly a pH of 3 to 5.1, e.g. 3.6 to 5.1 and containing a thickening agent to give a viscosity of at least 500 mPa. Without including a preservative, such an aqueous concentrated suspension of natamycin, will remain chemically and microbially stable for a period of days, e.g. more than 14 days, and exhibit physical stability for at least several hours. By physical

stability is meant that stirring is not necessary or that no more than gentle agitation every two hours for 5 minutes will suffice to keep the solid materials from settling down.

[0019] As hereinbefore indicated, the concentration of the natamycin in a stock suspension of the invention may be as high as 40% (w/w). Preferably the concentration is from 0.5 to 30%, more preferably from 2 to 25% and most preferably from 5 to 20%. For the preparation of a suspension according to the invention, natamycin as such may be used or a preparation containing natamycin. For instance, the commercially available powder compositions known under the brand name of Delvocid® Instant or Natamax® and containing 50% (w/w) natamycin may conveniently be employed.

[0020] Thus, in another aspect, the present invention provides a method of a preparing a suspension of the invention which comprises adding appropriate additives including natamycin and thickening agent, either separately or as a powder composition, to water and mixing, followed if necessary by adjustment of the pH. Preferably, a powder composition comprising the natamycin, the thickening agent, and a surfactant, optionally together with a buffering agent, will be mixed with water, followed if appropriate by pH adjustment.

[0021] Any thickening agent which is known in the art or any combination of known thickening agents may in principle be used for the preparation of such suspensions. Examples of suitable thickening agents are xanthan gum, Arabic gum, tragacanth gum, gellan gum, guar gum, locust bean gum, carrageenan gum, rhamnan gum, alginate, polyvinyl acetate and thickening agents of cellulosic origin like hydroxypropylmethylcellulose, hydroxypropylcellulose, carboxymethylcellulose and methylcellulose. Preferred thickening agents are those which have thixotropic or shear thinning and/or pseudoplastic properties such as for example methylcellulose, xanthan gum, carrageenan gum, Arabic gum and combinations thereof.

[0022] The thickening agent is preferably used in an amount of from 0.1 to 5.0% (w/w), more preferably from 0.1 to 3.0% (w/w) and most preferably from 0.2 to 2.0% (w/w).

[0023] When a thickening agent without shear thinning properties is used, the viscosity of the suspension will be at least about 500 mPa, more preferably from about 1000 to 5000 mPa and most preferably from about 1000 to 3000 mPa. When a thickening agent with shear thinning properties like xanthan is used, the viscosity of the suspension without shear may be more than 50,000 mpa, while the viscosity under shear will be dependent on the applied shear.

[0024] Advantageously, a suspending agent is used which serves as a deflocculant. Suitable suspending agents are for instance microcrystalline cellulose-sodium carboxymethylcellulose (Avicel® RC), sodium dodecyl sulphate, polyethylene glycol, fumed silica, glycol and glycerol.

[0025] The pH of a suspension according to the invention may be adjusted by any method known in the art, e.g. by adding an acidic or an alkalic compound or by using a buffering system. Useful acids are for example citric acid, lactic acid, ascorbic acid, hydrochloric acid, phosphoric acid, sulphuric acid and tartaric acid. Useful basic compounds are for example sodium hydroxide, potassium hydroxide, ammonia and calcium hydroxide. Useful buffering systems are for instance those of the phosphate and/or of the citrate type.

[0026] As indicated above, a solid powder composition for combination with water to provide a suspension according to the invention should preferably at least contain the polyene fungicide, a thickening agent like xanthan or methylcellulose, and optionally a surfactant like sodium dodecyl sulphate. The presence of a buffering system in the solid powder composition may be of advantage, but is not essential. The formulation may also contain components which are already present in a starting polyene fungicide preparation. For example, when Delvolid® Instant or Natamax® is used as a source of natamycin, lactose will also be present in the final blend.

[0027] The amount of the polyene fungicide such as natamycin trihydrate in a solid compositions for use in the preparation of a suspension of the invention may be up to 99.8% (w/w), e.g. 80 to 99.8% (w/w), preferably up to 99.5%. Preferably the amount of the thickening agent in such a solid composition is from 0.2 to 20% (w/w), more preferably from 0.5 to 10% (w/w). The amount of the surfactant is preferably from 0.1 to 2% (w/w), more preferably from 0.2 to 1% (w/w). A buffering system may be present at up to 20% (w/w). Useful buffering systems may consist of one or more of citric acid, the mono-, di-, and trisodium salts of citric acid and the mono- and disodium salts of phosphoric acid. Finally, it is obvious that filling agents like lactose and/or cellulose may also be present in the final solid composition.

[0028] After mixing the solid powder composition with water to give a stock suspension, if necessary, the pH of the resulting mixture will be adjusted to an appropriate value by methods known *per se*.

[0029] In further aspects, the present invention provides use of a suspension according to the invention directly for treatment of a food, feed or agricultural product or for the preparation of a treatment liquid or coating emulsion for such treatment.

[0030] As stated above, suspensions prepared in accordance with the present invention are very convenient for use as a stock suspension. For example, such suspensions are very useful for preparing immersion liquids for treating food and for the large scale production of coating emulsions for the treatment of cheeses. Further, such suspensions are convenient for use as part of a continuous process, e.g. to produce coating emulsions for the treatment of feed. Moreover neither for their preparation or their application is complicated equipment required. Mostly, the use of a simple stirring

device will satisfy. An additional advantage of using a suspension according to the invention as a stock for preparation of treatment liquids is that dust problems and lump forming are minimized.

[0031] Embodiments of the present application are illustrated by the following examples.

Example 1

[0032] This example demonstrates the microbial and chemical stability of suspensions according to the invention.

1a. 100 g of Delvolid® Instant (containing 50% of natamycin), 0.1 g of sodium dodecyl sulphate and 10 g of methylcellulose 400 CP (Sigma) were mixed together. The mixture was then suspended into 390 ml of water using a magnetic stirrer. The pH of the suspension was adjusted to 4.8 by means of a 1N solution of hydrochloric acid.

1b. The experiment was repeated except that the pH was adjusted to 4.4 instead of 4.8.

1c. The experiment was repeated except that the pH was adjusted to 4.0 instead of 4.8.

1d. The experiment was repeated except that the pH was adjusted to 3.6 instead of 4.8.

1e. The above experiment was repeated except that the pH was adjusted to 4.0 using a solution of acetic acid instead of hydrochloric acid.

1f. 100g of Delvolid® Instant, 0.1 g of sodium dodecyl sulphate, 10g of methylcellulose 400 cp and 0.1 g of ascorbic acid were mixed together and then suspended into 390 ml of water. The pH of the suspension was adjusted to 4 by means of a 1N solution of sodium hydroxide.

[0033] 50 ml of each of the above mixtures were inoculated with a mixture of respectively 3.4×10^6 CFU/ml of *Staphylococcus aureus* ATCC 6538, 2.9×10^6 CFU/ml of *Escherichia coli* ATCC 11229, 5.5×10^4 CFU/ml of *Bacillus cereus* ATCC 2 and 1.5×10^5 CFU/ml of *Lactococcus lactis* ATCC 19257. After incubation at 25°C for 14 days, the total cell count was estimated using methods known *per se*. Composition 1a had a total cell count of more than 10^7 CFU/ml while the other compositions contained less than 200 CFU/ml.

[0034] The above results showed that a pH value of lower than 4.8 is sufficient to inhibit bacterial growth.

[0035] The natamycin content of each suspension was estimated by HPLC immediately after preparation and after 13 days storage at 25°C. None of the six mixtures showed a decline in the natamycin concentration.

Example 2

[0036] In this experiment the effect of viscosity on the sedimentation of natamycin was investigated.

[0037] Aqueous suspensions containing 20% (w/w) of

Delvolid® Instant, 0.1% (w/w) of sodium dodecyl sulphate and respectively 1.8%, 1.6% and 1.4% (w/w) of methylcellulose 400 cp and with 0.7% of methylcellulose 4000 cp were prepared according to the method described in Example 1. The pH of the suspensions was adjusted to 4.0 by means of a 1N solution of hydrochloric acid.

[0038] The viscosities of the resulting suspensions as measured with a Brookfield viscosimeter were respectively 2740, 1910, 1080 and 2380 mPa.

[0039] To check the sedimentation of the natamycin, 100 ml of each of the suspensions was put into a measuring cylinder of 100 ml. The phase separation was judged visually. No phase separation was observed during more than 8 hours for the suspension with the lowest viscosity (1080 mPa) and during more than 24 hours for the other four mixtures.

Example 3

[0040] 106 g of natamycin trihydrate, 4 g of xanthan gum (Keltrol® RD, Kelco International Limited) and 0.5 g of sodium dodecyl sulphate were mixed together and then added to 990 ml of water. After stirring the mixture for 30 minutes, the pH was adjusted to 4.0 by means of a 1N solution of hydrochloric acid.

[0041] The sedimentation characteristics were checked visually by putting 100 ml of the resulting suspension into a measuring cylinder of 100 ml. Even after two weeks standing no phase separation was observed.

[0042] The microbial and chemical stability was checked in the same way as described in Example 1.

[0043] After incubation at 25°C for 14 days, the microbial cell count was less than 200 CFU/ml. HPLC analysis showed that the natamycin content immediately after preparation and after storage at ambient temperature for 14 days was respectively 10.2 and 10.0% (w/w).

Example 4

[0044] 200 g of Delvolid® Instant, 0.2 g of sodium dodecyl sulphate and 4 g of Keltrol® RD were mixed together and then suspended into 796 ml of water by stirring for 30 minutes. The pH of the suspensions was adjusted to 4.0 by means of a 1N solution of hydrochloric acid.

[0045] The resulting suspension showed no sedimentation after standing for more than 14 days. The microbial and chemical stability was checked in the same way as described in Example 1. After incubation at 25°C for 14 days, the microbial cell count was less than 200 CFU/ml. HPLC analysis showed that the natamycin content immediately after preparation and after storage at ambient temperature for 14 days was respectively 10.5 and 10.7% (w/w).

Example 5

[0046] A wettable powder of the following composition was produced in a Turbula® mixer: 100 g of natamycin trihydrate, 100 g of lactose, 4 g of Keltrol® RD, 1 g of sodium dodecyl sulphate, 1 g of citric acid and 0.1 g of trisodiumcitrate dihydrate. The components were mixed together.

[0047] The wettable powder is suspended into 800 ml of water giving a total volume of 1000 ml and stirred for 30 minutes.

[0048] The pH of the suspension was measured immediately after preparation and after 14 days storage in the dark at room temperature. In both cases the pH was 4.04.

[0049] Sedimentation characteristics were checked in the same way as described in Example 3. The suspension showed no sedimentation after standing for more than 14 days.

[0050] The microbiological stability was checked using the well known challenge test method.

[0051] Five samples of 50 ml of the suspension were inoculated with respectively 3.8×10^3 CFU/ml of *Escherichia coli* ATCC 11229, 7.7×10^3 CFU/ml of *Staphylococcus aureus* ATCC 6538, 1.5×10^4 CFU/ml of *Listeria monocytogenes* DSM 20500, 9.2×10^3 CFU/ml of *Bacillus cereus* ATCC 2 and 1.8×10^3 CFU/ml of *Lactococcus lactis* ATCC 19257.

[0052] After incubation at 30°C for 1 hour, 7 days and 14 days samples were taken and the total cell count of each sample was determined using well known methods.

[0053] All samples contained less than 10 CFU/ml, which demonstrates that the suspension is microbiological stable for at least 14 days.

[0054] The natamycin content of the suspension was estimated by HPLC immediately after preparation and after 14 days storage in the dark at ambient temperature. The natamycin content in both cases was 10.4% (w/w).

Example 6

[0055] A wettable powder with the same composition as described in Example 5 was prepared and stored for more than 2 months at room temperature.

[0056] A natamycin suspension was produced as described in Example 5.

[0057] The results concerning physical, microbiological and chemical stability were the same as described in Example 5.

Example 7

[0058] A wettable powder of the following composition was produced in a Turbula® mixer: 106 g of natamycin trihydrate, 8.3 g of lactose, 1 g of Keltrol® RD, 0.5 g of citric acid and 0.055 g of sodiumcitrate dihydrate. The

components were mixed together. 54 g of the wettable powder was suspended into 196 ml of water by stirring for 30 minutes (suspension A).

[0059] From the half of suspension A the pH was adjusted to 6.5 by means of a 4N solution of NaOH (suspension B).

[0060] The pH of suspension A was measured immediately after preparation (pH = 4.87) and after 14 days storage in the dark at room temperature (pH = 5.04).

[0061] Sedimentation characteristics of suspension A were checked in the same way as described in example 3. The suspension showed no sedimentation after standing for more than 14 days.

[0062] After incubation at room temperature the total cell count of suspension A was determined after 1 hour, 7 days and 14 days using well known methods.

[0063] All samples contained less than 10 CFU/ml, which demonstrates that the suspension is microbiological stable for at least 14 days.

[0064] After incubation at room temperature the total cell count of suspension B was more than 10^7 CFU/ml after 4 days.

[0065] The above results showed that a pH value of higher than 6.5 is insufficient to inhibit bacterial growth.

[0066] The natamycin content of suspension A was estimated by HPLC immediately after preparation and after 14 days storage in the dark at ambient temperature. The natamycin content was respectively 18.0 and 18.1% (w/w).

Claims

1. An aqueous suspension of natamycin having a pH of 3 to 6 and containing a thickening agent to give a viscosity of at least 500 mPa.
2. An aqueous suspension as claimed in claim 1 having a pH of 3.6 to 5.1.

3. An aqueous suspension as claimed in claim 1 or claim 2 wherein a thickening agent is present to give a viscosity of at least 1000 mPa.

4. An aqueous suspension as claimed in any one of claims 1 to 3 wherein the natamycin is present at 0.5 to 40% (w/w) and the thickening agent is present at 0.1 to 5% (w/w).

5. An aqueous suspension as claimed in any one of claims 1 to 4 wherein the thickening agent is selected from xanthan gum, Arabic gum, tragacanth gum, gellan gum, guar gum, locust bean gum, carrageenan gum, rhamnan gum, alginate, polyvinylacetate, hydroxypropylmethylcellulose, hydroxypropylcellulose, carboxymethylcellulose, methylcellulose and combinations thereof.

6. An aqueous suspension as claimed in any one of claims 1 to 5 which additionally contains a surfactant.

7. A method for preparing a suspension as claimed in any one of the preceding claims which comprises adding appropriate additives including natamycin and thickening agent, either separately or as a powder composition, to water and mixing, followed if necessary by adjustment of the pH.

8. A powder composition for use in a method according to claim 7 comprising natamycin, a thickening agent and a surfactant.

9. Use of an aqueous suspension as claimed in any of claims 1 to 6 for preparation of a treatment liquid or coating emulsion for treatment of a food, feed or agricultural product.

10. Use of an aqueous suspension as claimed in any one of claims 1 to 6 for treatment of a food, feed or agricultural product.

11. A food, feed or agricultural product having applied thereto a suspension as claimed in any one of claims 1 to 6.

Patentansprüche

1. Wäßrige Suspension von Natamycin mit einem pH-Wert von 3 bis 6 und einem Gehalt an einem Verdickungsmittel, das eine Viskosität von mindestens 500 mPa ergibt.
2. Wäßrige Suspension nach Anspruch 1 mit einem pH-Wert von 3,6 bis 5,1.
3. Wäßrige Suspension nach Anspruch 1 oder 2, in der ein Verdickungsmittel vorliegt, das eine Viskosi-

tät von mindestens 1000 mPa ergibt.

4. Wäßrige Suspension nach einem der Ansprüche 1 bis 3, worin das Natamycin in einer Menge von 0,5 bis 40 % (Gewicht/Gewicht) und das Verdickungsmittel in einer Menge von 0,1 bis 5 % (Gewicht/Gewicht) vorliegt. 5
5. Wäßrige Suspension nach einem der Ansprüche 1 bis 4, worin das Verdickungsmittel aus Xanthangummi, Gummi arabicum, Tragantgummi, Gellangummi, Guar gummi, Johannisbrotgummi, Carrageengummi, Rhamxangummi, Alginat, Polyvinylacetat, Hydroxypropylmethylcellulose, Hydroxypropylcellulose, Carboxymethylcellulose, Methylcellulose und Kombinationen dieser Stoffe ausgewählt ist. 10 15
6. Wäßrige Suspension nach einem der Ansprüche 1 bis 5, die zusätzlich ein oberflächenaktives Mittel enthält. 20
7. Verfahren zum Herstellen einer Suspension nach einem der vorstehenden Ansprüche, bei dem geeignete Zusatzstoffe, einschließlich Natamycin und eines Verdickungsmittels, entweder getrennt oder als pulverförmiges Gemisch, zu Wasser gegeben werden und gemischt wird, bei Bedarf gefolgt von einer Einstellung des pH-Werts. 25
8. Pulverförmiges Gemisch zur Verwendung bei einem Verfahren nach Anspruch 7, enthaltend Natamycin, ein Verdickungsmittel und ein oberflächenaktives Mittel. 30
9. Verwendung einer wäßrigen Suspension nach einem der Ansprüche 1 bis 6 zum Herstellen einer Behandlungsflüssigkeit oder einer Beschichtungsemulsion für die Behandlung eines Nahrungsmittels, Futtermittels oder landwirtschaftlichen Produkts. 35 40
10. Verwendung einer wäßrigen Suspension nach einem der Ansprüche 1 bis 6 zur Behandlung eines Nahrungsmittels, Futtermittels oder landwirtschaftlichen Produkts. 45
11. Nahrungsmittel, Futtermittel oder landwirtschaftliches Produkt, dem eine Suspension nach einem der Ansprüche 1 bis 6 zugegeben wurde. 50

Revendications

1. Suspension aqueuse de natamycine ayant un pH de 3 à 6 et contenant un agent épaississant pour donner une viscosité d'au moins 500 mPa. 55
2. Suspension aqueuse suivant la revendication 1, ayant un pH de 3,6 à 5,1.

3. Suspension aqueuse suivant la revendication 1 ou la revendication 2, dans laquelle un agent épaississant est présent pour donner une viscosité d'au moins 1000 mPa.
4. Suspension aqueuse suivant l'une quelconque des revendications 1 à 3, dans laquelle la natamycine est présente de 0,5 à 40% (p/p) et l'agent épaississant est présent de 0,1 à 5% (p/p).
5. Suspension aqueuse suivant l'une quelconque des revendications 1 à 4, dans laquelle l'agent épaississant est sélectionné parmi de la gomme xanthane, de la gomme arabique, de la gomme adragante, de la gomme gellane, de la gomme guar, de la gomme de caroube, de la gomme carraghénane, de la gomme rhamxane, de l'alginate, de l'acétate de polyvinyle, de l'hydroxypropylmethylcellulose, de l'hydroxypropylcellulose, de la carboxyméthylcellulose, de la méthylcellulose et des combinaisons de ceux-ci.
6. Suspension aqueuse suivant l'une quelconque des revendications 1 à 5, contenant en outre un tensioactif.
7. Procédé pour la préparation d'une suspension suivant l'une quelconque des revendications précédentes, qui comprend l'addition d'additifs appropriés incluant de la natamycine et un agent épaississant, soit séparément, soit sous la forme d'une composition de poudre, à de l'eau et au mélange, suivis si nécessaire par un ajustement du pH.
8. Composition de poudre pour une utilisation dans un procédé suivant la revendication 7, comprenant de la natamycine, un agent épaississant et un tensioactif.
9. Utilisation d'une suspension aqueuse suivant l'une quelconque des revendications 1 à 6, pour la préparation d'un liquide de traitement ou d'une émulsion de revêtement pour le traitement d'un aliment, de nourriture pour animaux ou d'un produit agricole.
10. Utilisation d'une suspension aqueuse suivant l'une quelconque des revendications 1 à 6, pour le traitement d'un aliment, d'un aliment pour animaux ou d'un produit agricole.
11. Aliment, aliment pour animaux ou produit agricole auxquels on applique une suspension suivant l'une quelconque des revendications 1 à 6.
